Change in the nature of data

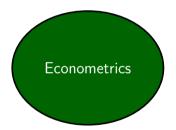

The phrase 'big data' emphasizes a change in the scale of data. But there has been an equally important change in the nature of this data. Machine learning can deal with unconventional data that is too high-dimensional for standard estimation methods, including image and language information that we conventionally had not even thought of as data we can work with, let alone include in a regression.

Mullainathan et al. (2017)

Motivation 2 / 40

Calls to extend the econometric toolkit

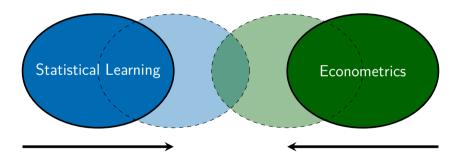

Motivation 3 / 40

Calls to extend the econometric toolkit

Varian (2014), Mullainathan et al. (2017), Athey et al. (2019), Gentzkow et al. (2019), ...

Convergence of methodological fields

Motivation 3 / 40

Statistical Learning in Economics

Statistical learning thrives in modeling $f(\mathbf{x})$:

$$\hat{f}(\mathbf{x}) = \begin{cases} \hat{y} & \text{given pairs of } (y, \mathbf{x}) \\ cluster_j & \text{given } \mathbf{x} \end{cases}$$
 supervised learning unsupervised learning

Economists are typically interested in **parameter estimation** and put more structure on their models:

$$f(\mathbf{x}) = \beta \mathbf{x} + \epsilon \longrightarrow \hat{f}(\mathbf{x}) \longrightarrow \hat{\beta}$$

My research

Obtain \hat{y} or $cluster_j$ from typically unstructured, high-dimensional \mathbf{x} to open new perspectives on economic research questions of the kind $y = \beta \mathbf{x} + \epsilon$.

Motivation 4 / 40

02	Applications

Mapping Technologies to Business Models: An Application to Clean

published as part of the the 26th International Conference on Science. Technology and Innovation Indicators (STI2022) Conference Proceedings

Technologies and Entrepreneurship

Technological innovation and its measurement

Technological innovation and its measurement

Patents have become a surrogate for measuring the innovation process.

Jaffe (2021)

Technological innovation and its measurement

Patents have become a surrogate for measuring the innovation process.

Jaffe (2021)

Patent subclasses provide a [...] reliable picture of a firm's technological capabilities. Aharonson et al. (2016)

Patents and start-ups

A measurement problem

Start-ups barely file patents (Graham et al., 2008; Helmers et al., 2011):

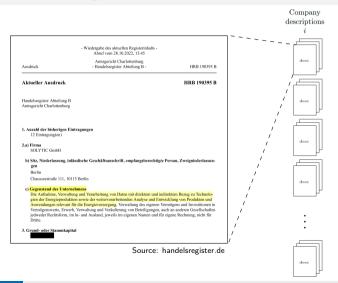

- ▶ distracting engineers/managers from key functions (Mann, 2005)
- ► costs of patenting/patent litigation too high (Graham et al., 2009)
- ▶ disclosure through patent allows 'design around' (Mann, 2005)
- ▶ patents impact VC decisions as property rights, not as signals of technology quality (Hoenig et al., 2015)

Research question I

How to capture the role of start-ups in the innovation process?

Textual innovation data

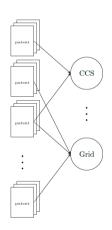

Legal obligation to publish business purpose at business registration

Textual innovation data

Patent texts and assigned technology classes

Patent documents Technology classes

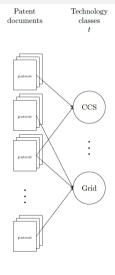

CCS Carbon capture, storage and sequestration Adaption Technologies for the adaption to climate change Battery Battery storage and fuel cell technologies Biofuels Biofuel technologies E-efficiency Technologies improving energy efficiency Generation Renewable energy generation technologies Materials Low carbon materials and manufacturing Mobility Electric vehicles and low carbon mobility solutions Water Water and wastewater treatment Grid Grid and power conversion technologies

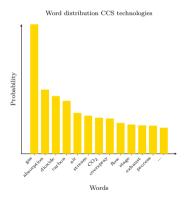

From patents to technology descriptions

L-LDA (Ramage et al., 2009)

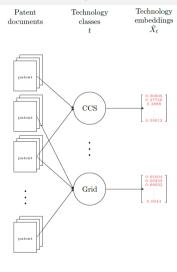

<u>Goal:</u> Derive technology-word distributions from expert-labeled corpus of patent docs

Contextualized vector representations

BERT (Devlin et al., 2018)

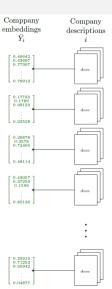

<u>Goal:</u> Derive contextualized vector representations of technology & business descriptions

$$X_{CCS} = \langle \text{gas, absorption, dioxide}, \dots, \text{scrub}, \dots \rangle$$

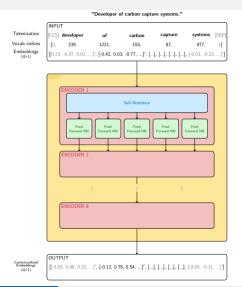

$$\text{SBERT} \; \Big| \;$$

$$X_{CCS}_{(1\times384\ \forall\ Q)} = [0.006, 0.277, 0.288, \dots 0.590]'$$

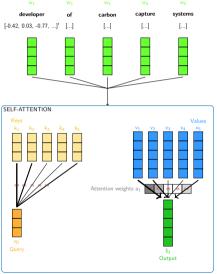

Excursus: BERT

Model architecture

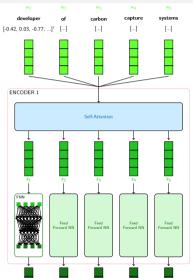

Attention Is All You Need (Vaswani et al., 2017)

Let tokens 'look around' the whole input, and decide how to update its representation based on on what it sees

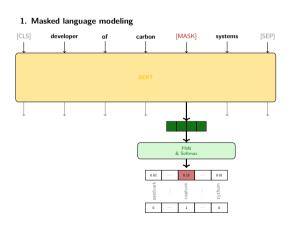

Encoder

After Attention, each token pondering for itself about what it has observed previously

Training BERT

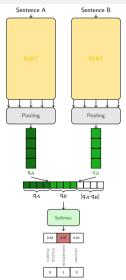

Self-supervised learning based on English Wikipedia

2. Next sentence prediction Sentence A Sentence B [CLS] developer of carbon [MASK] systems [SEP] innovate clean & Softmax

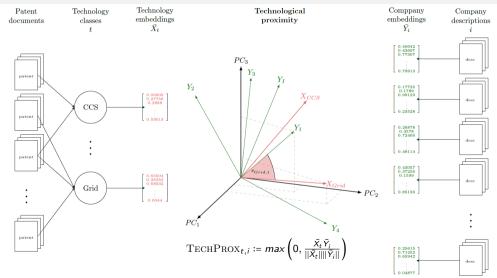

Finetuning BERT: SBERT (Reimers et al., 2019)

Finetuning based on collection of sentence pairs labeled for entailment, contradiction, and semantic independence

Mapping framework

Cosine similarity as measure of a company's technological orientation

Role of start-ups in clean technology diffusion

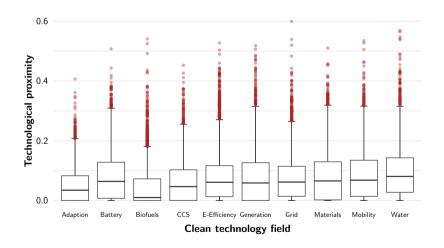

Fight against climate change requires new technological pathways and radical innovations (*inter alia* European Commission (2019), United Nations (2015))

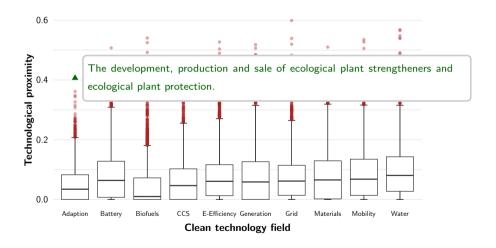

- ▶ but: technological path dependencies and system/innovation inertia among incumbents (Aghion et al., 2016; Patel et al., 1997)
- costly: delay in redirecting innovation towards clean technologies (Benner, 2009; Dijk et al., 2016; Sick et al., 2016)
- ⇒ special role of new (path-independent!) ventures in driving clean technology change

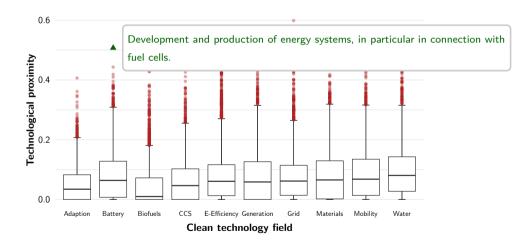

Research question II

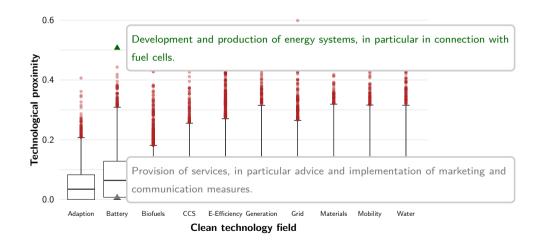

Which role do start-ups play in the technological transition to higher levels of decarbonization?

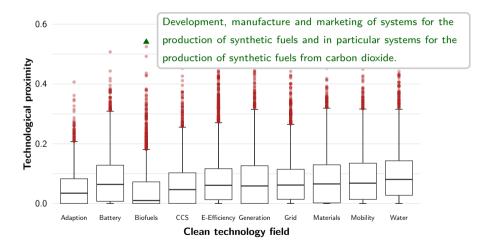

TECHPROX in survey of German start-ups

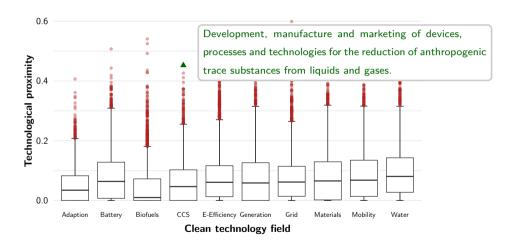

Characteristics of clean technology start-ups

Cleantech start-ups show a higher propensity to eco-innovate

Note:

Elnno := Introduction of environmental innovation?

⁻ no environmental innovation - environmental innovation with moderate environmental effect - environmental innovation with substantial environmental effect

Coefficient estimates reported as proportional odds ratios. Significance levels: *: p < 0.10, ***: p < 0.05, ***: p < 0.01

Summary

- ► Latest evolutions in the field of NLP allow fine granular determination of a firm's technological profile
- ► Legal obligation to publish a business purpose makes the technology mapping possible for start-ups even w/o traditional innovation data
- Leveraging the introduced technology mapping to the field of clean technologies suggests:
 - ▶ a high propensity of cleantech start-ups to introduce eco-innovations
 - supporting their special role in the transition to a green economy derived from theory
 - both by virtue of their business models as well as a high propensity to adopt additional environmental innovations

Small firms and the COVID-19 insolvency gap

An integrated data framework for policy guidance during the coronavirus pandemic: Towards real-time decision support for economic policymakers

Motivation - lack of real-time economic data

Source: The Economist (2021a)

Motivation - lack of real-time economic data

Does anyone really understand what is going on in the world economy? The pandemic has made plenty of observers look clueless.

Especially in times of rapid change, policymakers have operated in a fog.

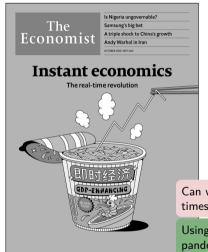

The gap between official data and what is happening in the real economy can still be glaring.

The Economist (2021a, 2021b)

Can we assist policy makers with **timely** and **insightful** firm level data in times of dynamic economic shocks such as COVID-19?

Source: The Economist (2021a)

Motivation - lack of real-time economic data

Does anyone really understand what is going on in the world economy? The pandemic has made plenty of observers look clueless.

Especially in times of rapid change, policymakers have operated in a fog.

The gap between official data and what is happening in the real economy can still be glaring.

The Economist (2021a, 2021b)

Can we assist policy makers with **timely** and **insightful** firm level data in times of dynamic economic shocks such as COVID-19?

Using firm communication patterns from corporate websites about the pandemic's effects on their business and classify these with a fine-tuned language model to obtain leading indicators at near real-time.

Technology-company mapping framework

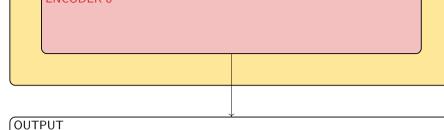

"Developer of carbon capture systems."

Tokenization
Vocab indices
Embeddings $(Q \times 1)$

ENCODER 1

INPU	Т					
[CLS]	developer	of	carbon	capture	systems	[SEP]
[0,	239,	1221,	155,	87,	977,	1]
[[0.23	, -0.07, 0.01,]′, [-0.42, 0.0	3, -0.77,]′, [.], [], [], []	, [-0.03, -0.23	3,]′]

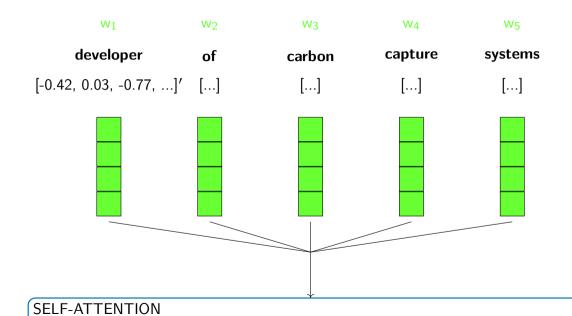

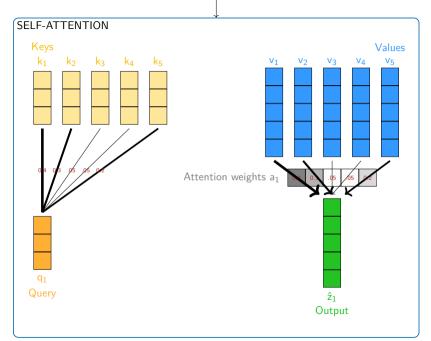

Contextualized Embeddings

 $(Q \times 1)$

[[-0.03, 0.98, 0.22, ...]', [-0.12, 0.78, 0.54, ...]', [...], [...], [...], [...], [-0.83, -0.11, ...]']

1. Attention weights a_{1:5} are query-key similarities:

$$\hat{a}_i = \mathbf{q}_i \times \mathbf{k}_i$$

Normalized via softmax: $a_i = e^{\hat{a}_i} / \sum_i e^{\hat{a}_j} \in [0, 1]$

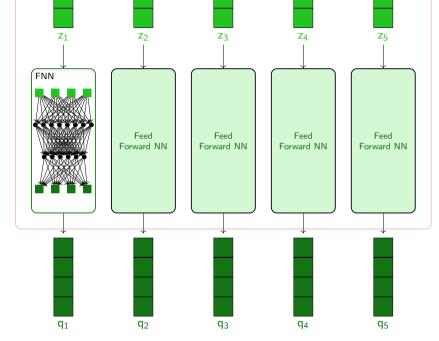

2. Output $\widehat{\mathbf{z}}_i$ is attention-weighted average of value vectors $\mathbf{v}_{1:5}$:

$$\widehat{\mathbf{z}}_i = \sum_i a_i \mathbf{v}_i$$

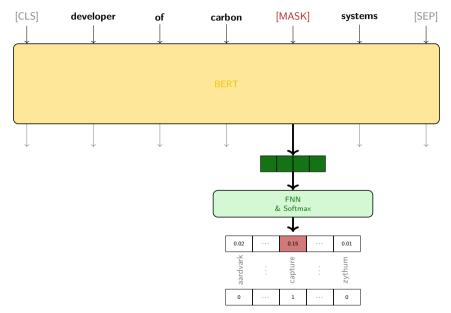

3. k, v and g are derived from the entire input w:

$$\mathbf{k} = W_k \times \mathbf{w}$$
 $\mathbf{v} = W_v \times \mathbf{w}$ $\mathbf{q} = W_q \times \mathbf{w}$

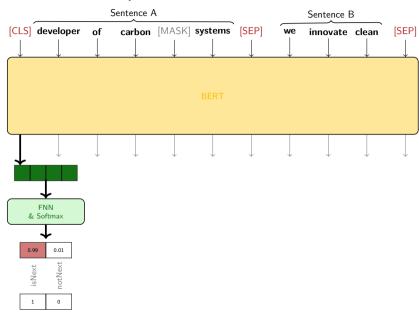

Note: Self-attention is repeated H times (multi-head attention) and the resulting vectors are concatenated along the feature dimension. Multiplying with a weight matrix W_z yields the final output vector that is passed to the FNN.

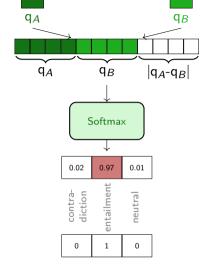

1. Masked language modeling

2. Next sentence prediction

Invention, Innovation & Entrepreneurship

A patent reflects new technical knowledge, but it does not indicate whether this knowledge has a positive economic value. Only those inventions which have been successfully introduced in the market can claim that they are innovations as well. While innovations and inventions are related, they are not identical.

Acs et al. (2005)

Text preprocessing

- 1. translation of non-English texts to English
- 2. Part of Speech (PoS) tagging
 - 2.1 remove punctuation, numbers and unknown tags
 - 2.2 lemmatization
- 3. stop word deletion

A labeled corpus of patent abstracts

Patent	Technology class	Abstract
1	B, C, Y02C, Y02P	Catalyst, comprising one or more compounds of the perovskite-type as catalytically active component, is new, where the catalytically active component in the form of at least one layer is applied on a support body from an open cell foam ceramic material
2	A, Y02A, Y02C, Y02E	Absorber fluid, comprises a carbon dioxide binding absorbent and an ionic additive in a concentration, which is greater than a minimum concentration, so that the activity of the products formed by the connection of carbon dioxide to the absorbent is reduced
: P	: B, F, Y02C	: The invention relates to a power plant for generating electrical energy, comprising a combustion chamber for producing steam, at least one waste gas purification stage that is connected downstream, a separation stage for CO2

Note: Corpus comprises $P \sim 560,000$ patents (all patents filed by German firms after 1990) and a vocabulary size of $V \sim 370,000$ (after text preprocessing).

Vertical differentiation in technology classes

Classification system of the European Patent Office using the example of **carbon capture and storage technologies**:

CPC	COOPERATIVE PATENT CLASSIFICATION
Υ	New technological developments
Y02	Climate change mitigation (technologies)
Y02C	Carbon capture and storage technologies
Y02C20	Capture and disposal of greenhouse gases
Y02C20/10	- of N ₂ O

Latent Dirichlet Allocation

Core idea in Blei et al. (2003) seminal work on Latent Dirichlet Allocation (LDA): Model the generative process that led to the creation of a text corpus incorporating both:

- the observed words in the corpus' documents
- and the hidden topic structure within the corpus

in the imaginary data generating process.

The latter includes the distribution of topics over documents and the word distributions over topics.

Latent Dirichlet Allocation

Core idea in Blei et al. (2003) seminal work on Latent Dirichlet Allocation (LDA): Model the generative process that led to the cre-

the observed words in the corpus' documents

ation of a text corpus incorporating both:

and the hidden topic structure within the corpus

in the imaginary data generating process.

The latter includes the distribution of topics over documents and the word distributions over topics.

L-LDA (Ramage et al., 2009) extents upon LDA by taking into consideration document labelsin the generative process.

L-LDA in patent corpus:

- ▶ document ê patent, p
- word distributions over topics $\hat{=}$ semantic technology description, $p(\delta_t)$

Statistical Learning in L-LDA

Patent corpus D consisting of P distinct patent abstracts each of length N_p , generative process can be modeled as follows:

- 1. For each technology class $t \in \{1, ..., T\}$: generate word distribution $\delta_t \sim Dir(\beta)$
- 2. For each patent $p \in \{1, ..., P\}$: generate technology class distribution $\lambda_p \sim Dir(\alpha_p)$
- 3. For each of the word positions p, n, with $p \in \{1, ..., P\}$ and $n \in \{1, ..., N_p\}$:
 - 3.1 generate technology class assignment $z_{p,n} \sim Multinomial(\lambda_p)$
 - 3.2 and choose word $w_{p,n} \sim Multinomial(\delta_{z_{p,n}})$

$$p(\delta_{1:T}, \lambda_{1:P}, z_{1:P}, w_{1:P}) = \prod_{t=1}^{T} p(\delta_t) \prod_{p=1}^{P} p(\lambda_p) \left(\prod_{n=1}^{N_p} p(z_{p,n} | \lambda_p) p(w_{p,n} | \delta_{z_{p,n}}) \right)$$

Goal: Derive posterior distribution $p(\delta_t)$ from joint distribution $p(\delta_{1:T}, \lambda_{1:P}, z_{1:P}, w_{1:P})$

Importance of capture contextual meaning of words

- technical terms in technology descriptions:
 - $X_t = \langle \text{ gas, absorb, carbon, dioxide, desorption } \dots \rangle$
- ▶ non-technical terms in company descriptions:
 - Developer of direct air capture technology that safely and permanently removes CO2 from the air.
 - $\rightarrow Y_c = (\text{developer, direct, air, technology, safe, permanent, remove, co2})'$
- ▶ **But**: high semantic overlap between x_t and y_c as captured by token embeddings $\bar{X}_t(carbon) \approx \bar{Y}_c(co2)$ $\bar{X}_t(absorb) \approx \bar{Y}_c(remove)$
- ► Goal: Exploit these relations to capture adopters of a technology

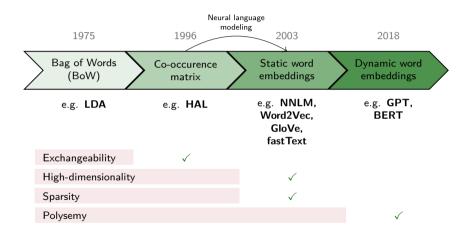

Classification performance of TechProx

Table: Performance of TechProx in distinguishing cleantech from non-cleantech firms

Label	Precision	Recall	F1-Score	Support
Cleantech	0.87	0.86	0.86	284
Non-cleantech	0.83	0.84	0.83	233
			0.85	517

Note: Performance measured on random test set with optimal values of Q = 15 and $\text{TechProx}_{min} = 0.27$. Optimal values for Q and TechProx_{min} have been determined on the validation set by tuning F1-Score.

Evolution of NLP

Word embeddings (1)

You shall know a word by the company it keeps!

Firth (1957)

General idea: exploit information on co-occurrence of words in large text corpora in order to learn the semantic meaning of a word as represented by a low-dimensional, dense vectors ($E \ll V$).

Natural Language Processing (NLP) as highly active field of research with major advances in recent years (see Wang et al. (2020)):

Neural Network Language Models

- ▶ 'distributed representation for words' (Bengio et al., 2003)
 - ▶ learn model that predicts next word given previous words
 - word embeddings carrying semantic meaning of a word as by-product

Word embeddings (2)

Static word embeddings

- ► Word2Vec (Mikolov et al., 2013)
 - neural network architecture specifically designed to learn word embeddings
 - Continuous Bag-of-Words (CBOW): predict word given its surrounding context words
 - Skipgram: predict context words given central word
- ► GloVe (Pennington et al., 2014)
 - direct exploitation of co-occurence statistics from large text corpora
- ► fastText (Bojanowski et al., 2017; Joulin et al., 2017)
 - learning embeddings for character n-grams and representing words as the sum of the n-gram embeddings (towards multi-language models)

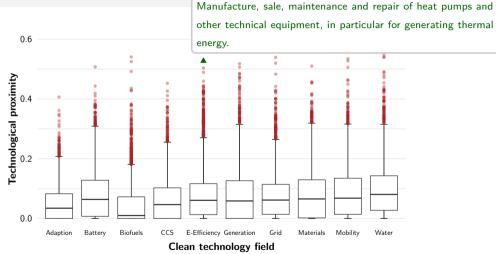

Word embeddings (3)

Contextualized word embeddings

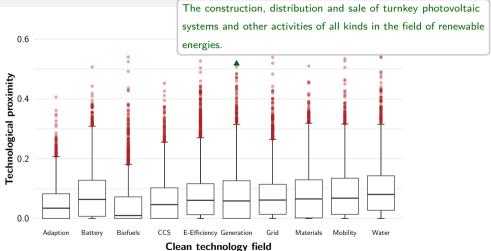

Tackle the issue that words have different meanings in different contexts (polysemy)

- ► ELMo (Peters et al., 2018)
 - use bidirectional LSTM to capture whole sentence (context!) in order to model embeddings of words in sentence
- ▶ ULMFit (Howard et al., 2018)
 - ▶ introduce a general language model and a process to fine-tune to domain-specific NLP tasks
- ► GPT (Radford et al., 2018)
 - ▶ use transformer network architecture to learn linguistic long-term dependencies
- ► BERT (Devlin et al., 2018)
 - Consider bidirectional contexts and relation of sentence pairs based on transformer encoders

IAB/ZEW Start-up survey

A representative sample of German start-up companies (Gottschalk, 2013)

Table: 2018 IAB/ZEW Start-up survey questions on environmental impacts and environmental innovation

Environmental impact

Does your company offer products or services which have the following environmental effects on the customer or the end user?

- 1. Reduction of energy consumption or CO₂ footprint for the customer.
- 2. Reduction of other emissions to the air, water, soil or noise for the the customer.
- 3. Reduction of material or resource consumption, for instance water, for the customer.
- 4. Improvement of recyclability of customer's products.
- Improvement of durability of customer's products.

Environmental innovation

Since its inception, has your company introduced innovations that have impacted the environment as follows?

- 1. Reduction of energy consumption or the overall CO_2 balance in your company.
- 2. Reduction of other emissions to the air, water, soil or noise in your company.
- 3. Reduction of material or resource consumption, for instance water, in your company.
- 4. Improvement of recyclability of your own products.
- 5. Improvement of durability of your own products.

Note: The questions have been asked on a Likert response scale with the following response possibilities. (1) No; (2) Yes. somewhat: (3) Yes. substantial.

Appendix Policy evaluation tool

Motivation

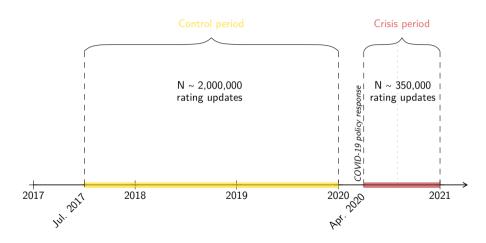

► COVID-19 caused many companies to fall **short of liquidity** (lockdown measures, drop in demand, logistical difficulties, ...).

► Federal government temporarily suspended the firms' obligation to file for insolvency

- (COVInsAG)
- ▶ as a result corporate insolvencies dropped substantially despite the worsened economic conditions
- but COVInsAG has been launched largely indiscriminately with little control on firms' pre-crisis conditions
 - risk that close to bankrupt firms remain in the market possibly absorbing aid measures as windfall gains
 - counterfactual scenario hard to construct (no controls)

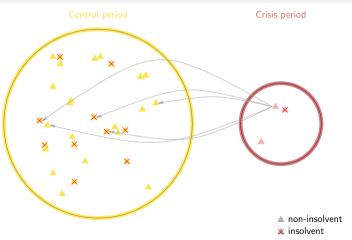

Control and crisis period

Towards a statistical learning framework

Statistical learning task

For each rating update from the crisis period find the k nearest neighbors (kNN) from the pre-crisis period that experienced the very similar rating updates and observe their insolvency state Insolvency rates

Insolvency Gap on the sector-size level

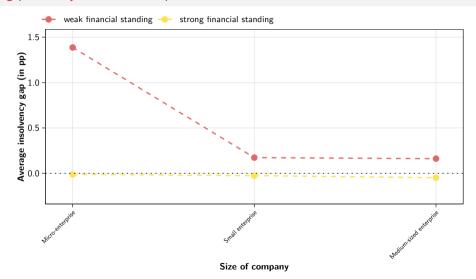

Substantial among micro-enterprises (≤ 10 employees) but vanishes with increasing firm size

Sector affiliation	Size of company		
	Micro <i>IĜ</i>	Small <i>IĜ</i>	Medium <i>IG</i>
Manufacturing	+1.0330***	+0.0192	-0.0413
Business-related services	+0.7037***	-0.0072	-0.0530
Food production	+0.2741	+0.2418	-0.1881
Others	+0.3703***	-0.0183	0.0000

Change in insolvency regime

Act to Mitigate the Consequences of the COVID-19 Pandemic under Civil, Insolvency and Criminal Procedure Law

of 27 March 2020

The Bundestag has adopted the following Act:

Article 1

Act to Temporarily Suspend the Obligation to File for Insolvency and to Limit Directors' Liability in the Case of Insolvency Caused by the COVID-19 Pandemic (COVID-19-Insolvenzaussetzungsgesetz – COVInsAG)

Source: Federal Ministry of Justice

Zombification of Economy?

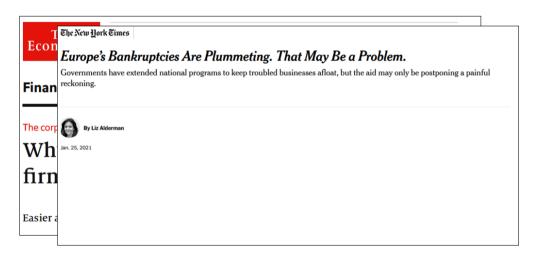

The corporate undead

Why covid-19 will make killing zombie firms off harder

Easier access to credit and government support means they will stumble on

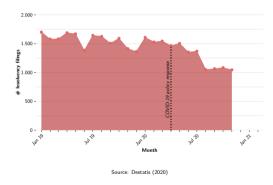

Zombification of Economy?

Zombification of Economy?

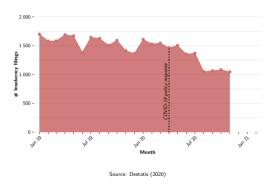

Corporate insolvencies and economic shocks

In 2020, 16% decrease in corporate insolvencies compared to 2019.

Corporate insolvencies and economic shocks

30,000 - 30,

In 2020, 16% decrease in corporate insolvencies compared to 2019.

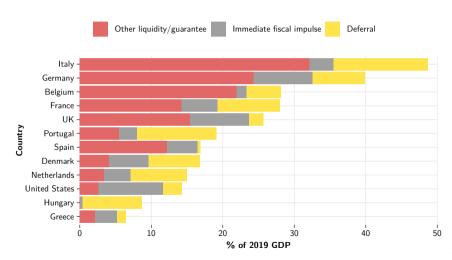

Typically, corporate insolvencies rise in times of economic crisis (cleansing mechanism).

Appendix 34 / 40

40.000

COVID-19 Fiscal Policy Response

By international comparison

Source: Bruegel

Cleansing mechanism of economic crises

Efficient resource reallocation:

- crises force unproductive companies out of the market
- ► freeing up resources
- ▶ that find more productive use elsewhere

(Caballero et al., 2008; Schumpeter, 1942)

Has the COVID-19 policy response impaired the cleansing effect typically observed in economic crises?

Nearest neighbor matching

Some more details

- ightharpoonup only match control units, j, from the same sector-size stratum
- within sector-size stratum calculate Mahalanobis distance (MD) between each possible pair of control and crisis unit, *i*, on

Nearest neighbor matching

Some more details

- ightharpoonup only match control units, j, from the same sector-size stratum
- ▶ within sector-size stratum calculate Mahalanobis distance (MD) between each possible pair of control and crisis unit, *i*, on
 - ▶ rating update (with caliper!): Δr_{it}
 - rating prior to update: $r_{i,t-x}$
 - number of downgrades preceding the update: d_{it}
 - average rating before the update: \bar{r}_{it}
 - ► company age: *a_{it}*

Nearest neighbor matching

Some more details

- ightharpoonup only match control units, j, from the same sector-size stratum
- ▶ within sector-size stratum calculate Mahalanobis distance (MD) between each possible pair of control and crisis unit, *i*, on
 - ▶ rating update (with caliper!): Δr_{it}
 - rating prior to update: $r_{i,t-x}$
 - ▶ number of downgrades preceding the update: dit
 - average rating before the update: \bar{r}_{it}
 - ► company age: a_{it}

$$MD_{ij} = \begin{cases} (\mathbf{X}_i - \mathbf{X}_j)' \Sigma^{-1} (\mathbf{X}_i - \mathbf{X}_j) & \text{if } |\Delta r_{it} - \Delta r_{jt}| \leq c \\ \infty & \text{if } |\Delta r_{it} - \Delta r_{jt}| > c \end{cases}$$

with $\mathbf{X} = (\Delta r_t \ r_{t-x} \ d_t \ \overline{r}_t \ a_t)'$, Σ as the variance-covariance matrix of \mathbf{X} in the pooled sample of in-crisis and all pre-crisis observations and c a predefined caliper on the rating update.

From insolvency rates to insolvency gap

Actual insolvency rate

$$IR_s^{actual} = \frac{N_s^{insolvent}}{N_s}$$

Counterfactual insolvency rate

$$IR_{s}^{counterfactual} = \frac{\sum_{j=1}^{\tilde{N}_{s}} w_{j,s} \, \mathbf{1}(f_{j,t+4}=1)}{\sum_{j=1}^{\tilde{N}_{s}} w_{j,s}}$$

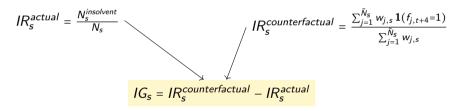

Insolvency gap

From insolvency rates to insolvency gap

Insolvency gap as the deviation between expected and observed insolvency rates

Actual insolvency rate

Counterfactual insolvency rate

Insolvency gap

Statistical Learning in kNN(1)

$$\begin{split} IR_s^{counterfactual} &= \frac{\sum_{j=1}^{\tilde{N}_s} w_{j,s} \, \mathbf{1}(f_{j,t+4} = 1)}{\sum_{j=1}^{\tilde{N}_s} w_{j,s}} \quad \text{with} \quad \tilde{N}_s = \sum_{j=1}^{\tilde{N}_s} w_{j,s} \\ &= \frac{1}{N_s} \sum_{i=1}^{N_s} Pr\left(f_{i,t+4} = 1 \mid X_i\right) \end{split}$$

Find k_s observations from pre-crisis control group which are closest to X_i and average their survival status:

$$\hat{f}(X_i) = Pr(f_{i,t+4} = 1 \mid X_i) = \frac{1}{k_s} \sum_{j \in N_k(X_i)} \mathbf{1}(f_{j,t+4} = 1)$$

Closeness is defined by Mahalanobis distance:

$$MD_{ij} = \begin{cases} (\mathbf{X}_i - \mathbf{X}_j)' \Sigma^{-1} (\mathbf{X}_i - \mathbf{X}_j) & \text{if } |\Delta r_{it} - \Delta r_{jt}| \leq c \\ \infty & \text{if } |\Delta r_{it} - \Delta r_{jt}| > c \end{cases}$$

√ariables:	
i	crisis observation
j	control observation
s	sector-size stratum
N_s \tilde{N}_s	number of observed firms in s
\tilde{N}_s	number of matched pre-crisis
	obs. in s
$w_{j,s}$	matching weight on j in s
$f_{i,t+4}$	survival status of j 4 month after
3,	rating update
X_i	observed firm characteristics of i
k _s	matched number of NNs in s
$N_k(X_i)$	k closest points in neighborhood
	of X_i
Δr_{it}	rating update of i in t

Matching details:

$$k_s = \frac{N_s^s}{N_s^{crisis}}$$
 caliper on Δr_t (= 8) matching with replacement crisis units w/o match neglected in IR_s^{actual}

Statistical Learning in kNN(2)

Why not simply calculate $IR_s^{counterfactual}$ on all pre-crisis observations that fall in the respective sector-size stratum?

- control for credit rating update!
- remove bias in comparing IR_s^a and IR_s^c due to additional firm characteristics whose distribution differs in control and crisis sample (Rubin, 1973)
 - e.g. larger firms more often evaluated by rating agency → these are more likely observed in the first months after the crisis

Company Size Definition

	Size of company			
	Micro	Small	Medium	Large
Number of employees	≤ 10	11 – 49	50 – 249	≥ 250
Annual tunover in M €	≤ 2	2 - 10	10 - 50	> 50
Annual balance sheet total in M \in	≤ 2	2 - 10	10 - 43	> 43

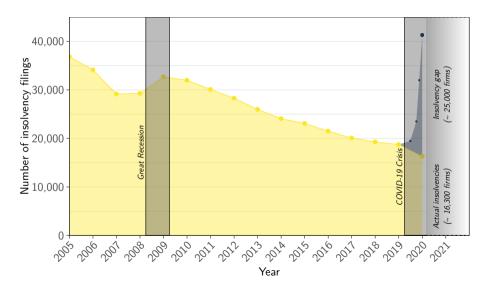

Note: Table shows translation of firm characteristics into company size classes used in this study as defined by European Commission (2003).

Insolvency Gap in Absolute Numbers (1)

	Size of company

Business-related services	287,115	0.0070	40,448	-0.0001	9,871	-0.0005	
Manufacturing	251,027	0.0103	50,447	0.0002	12,399	-0.0004	
Others	37,695	0.0037	5,381	-0.0002	2,398	0.0000	
Wholesale & retail trade	201,838	0.0107	46,342	0.0004	10,549	0.0001	
Weighted insolvency gap (in %)	0.0080		0.0003		-0.0003		
Number of active firms (official statistics)	3,109,261		293,610		63,928		3,466,79
Insolvency gap (absolute)	24,933		90		-19		25,00

Note: Insolvency gap in absolute terms is calculated as product between the weighted insolvency gap and the total number of active German firms within the respective size class.

Insolvency Gap in Absolute Numbers (2)

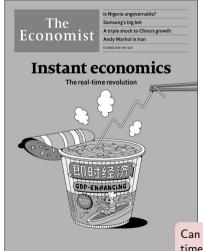

Main findings

- ▶ policy response allowed to prevent large-scale business insolvencies . . .
- ▶ at the cost of saving firms that would have likely ended insolvent *regardless* of the COVID-19 shock . . .
- ▶ possibly impeding efficient resource reallocation during the COVID-19 crisis

Appendix Leading indicator development

Motivation - lack of real-time economic data

Does anyone really understand what is going on in the world economy? The pandemic has made plenty of observers look clueless.

Especially in times of rapid change, policymakers have operated in a fog.

The gap between official data and what is happening in the real economy can still be glaring.

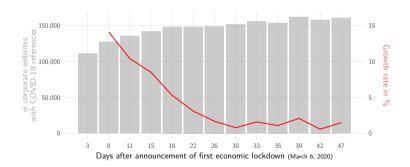

The Economist (2021a, 2021b)

Can we assist policy makers with **timely** and **insightful** firm level data in times of dynamic economic shocks such as COVID-19?

Source: The Economist (2021a)

Early firm communication and corporate websites

- ightharpoonup accessed corporate websites of $\sim 1.18M$ German companies from Mar 20 May 20 twice a week searching for references related to the pandemic
- ▶ finding: companies used their websites intensively to report about the pandemic

Turn website references into knowledge

But: context of Corona references greatly differed across firms:

'The Corona pandemic is not only affecting ongoing projects, but also the current selection rounds of the 13th and 14th funding seasons.'

Main contributions

- proposed a data framework for policy guidance in times of economic shocks
 Follow-up surveys
 Outcome analysis
- to overcome information deficits policy makers are confronted with in highly dynamic situations
- possibly allowing more targeted liquidity injections to support affected companies instead of choosing the 'bazooka' as policy instrument

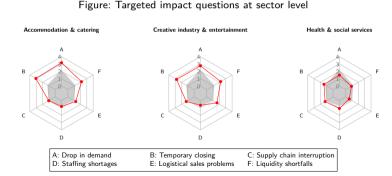

Classification of COVID-19 web references

Categories	Description	Examples (translated)
Problem	Firm reports about adverse impacts of the pandemic on its business operations.	Due to the Corona pandemic, are closed. This been cancelled due to the increasing concerns and escalated circumstances surrounding the recent coronavirus (COVID-19) outbreak.
Confidence	Firm indicates that the pandemic has no negative impacts on its business operations.	We are there for you 24/7 as usual despite Corona! Your advisor stands by your side - also in times of COVID-19.
Adaption	Firm reports that it is adapting to the new economic circumstances.	We have also upgraded our IT and telecommunications system. Our employees are now also able to ensure that you are looked after from home, should this be necessary. Since we receive new information on the development of the coronavirus, the measures and the safety precautions every day, we will continue to monitor the development and react to it.
		Within our emergency opening times, we particularly take care of those who are currently performing at their best for our society in view of the coronavirus crisis and who depend on their glasses for their work.
Information	Firm reports generally, not necessarily in a business-context, about the pandemic.	The corona pandemic affects each of us now and in the near future. There are many uncertainties and resulting (insurance) issues. What about entitlement to holiday cancellations, health protection abroad and coverage in the event of business interruption are just a few of the questions.
		In cooperation with the software provider, the Bundesverband Pflegemanagement (Federal Association of Care Management) is launching a platform to recruit former care professionals to cope with the currently dramatic challenges facing care against the background of the Corona crisis.
Unclear	COVID-19 reference does not come with further clearly distinguishable content.	Current situation COVID-19. COVID-19 and how it affects us.

Follow up surveys

- based on the early findings, construct targeted businesses surveys
- gain more detailed understanding about the sort of impact in order to design counter measures most effectively
- ▶ here: surveyed ~ 1,500 companies consecutively (Apr, Jun, Sep 2020) with targeted impact questions

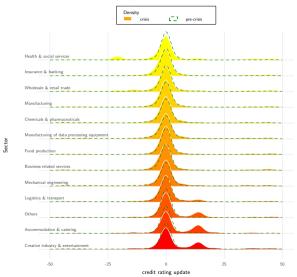

Retrospective analysis of firm outcomes

- after economic shock has materialized in economy, analyze firm outcomes
- understand possible long-term consequences and design stimulus programs
- ► here: examined credit rating updates of ~ 870,000 companies (between Jun 20 - Apr 21)

Retrospective analysis of firm outcomes
